

COMPUTING

The range of card-based systems depicted on the Monoco website are distinct and separate global networks with Internet connection to the worldwide telephony infrastructure. The graphic below illustrates the Internet connection between countries for installing automated Database Centres to register and validate the numerical identity of cardholders domiciled in every country for payment and security services.

The automated Database Centre for each card-based system is operated and managed by the master control program for processing millions of online transactions in numerical computation - the unified state for the Internet routing of numerical identifiers at the prime security level to authenticate the true identity of every cardholder issued with an impersonal card in the country of origin.
